RNA and Protein Synthesis is a compendium of articles dealing with the assay, characterization, isolation, or purification of various organelles, enzymes, nucleic acids, translational factors, and other components or reactions involved in protein synthesis. One paper describes the preparatory scale methods for the reversed-phase chromatography systems for transfer ribonucleic acids. Another paper discusses the determination of adenosine- and aminoacyl adenosine-terminated sRNA chains by ion-exclusion chromatography. One paper notes that the problems involved in preparing acetylaminoacyl-tRNA are similar to those found in peptidyl-tRNA synthesis, in particular, to the lability of the ester bond between the amino acid and the tRNA. Another paper explains a new method that will attach fluorescent dyes to cytidine residues in tRNA; it also notes the possible use of N-hydroxysuccinimide esters of dansylglycine and N-methylantranilic acid in the described method. One paper explains the use of membrane filtration in the determination of apparent association constants for ribosomal protein-RNS complex formation. This collection is valuable to bio-chemists, cellular biologists, micro-biologists, developmental biologists, and investigators working with enzymes.

This unique book closes the gap between psychology books and the research that made them possible. Its journey through the "headline history" of psychology presents 40 of the most famous studies in the history of the science, and subsequent follow-up studies that expanded their findings and relevance. Readers are granted a valuable insider's look at the studies that continue to be cited most frequently, stirred up the most controversy when they were published, sparked the most subsequent related research, opened new fields of psychological exploration, and changed most dramatically our knowledge of human behavior. For individuals with an interest in an introduction to psychology.

In a tribute to the far latitudes, Gretel Ehrlich travels across Greenland, the largest island on earth. All but five per cent of the island is covered by a vast ice sheet, an enduring remnant of the last ice age. Despite a uniquely hostile environment, it has been inhabited continuously for thousands of years. Greenlanders retain many of their traditional practices: some still hunt on sleds made from whale and caribou with packs of dogs; others fashion harpoons from Narwhal tusks; and entranced shamans make soul fights under the ice. Ehrlich mixes stories of European anthropologists who have recorded the ways of the Inuit, with artists who have lived briefly on Greenland's fringe in order to try to capture its extraordinary pure light. She travels across this unearthly landscape in the company of men and women who have a deep bond with it, and with them she discovers the realm of the Great Dark, ice pavilions, polar bears and Eskimo nomads.

The book's focus is basic chemistry, but along the way it branches out into full-length chapters/appendices on particle physics, mathematics, information theory, probability and philosophy-of-science. In the end, it is more philosophical treatise than chemistry text, although it does include a number of hands-on kitchen chemistry experiments, as an integral part of the advocated philosophy.
