Solution to Problem 1: Let us use the figure below and set. $a = 10$ cm, $b = 7$ cm and $c = 5$ cm. We now use cosine law to find the largest angle A. $a^2 = b^2 + c^2 - 2bc \cos(A)$ Substitute a , b and c by their values and solve for $\cos(A)$ $\cos(A) = [b^2 + c^2 - a^2] / 2bc$. $\cos(A) = [7^2 + 5^2 - 10^2] / (2 \cdot 7 \cdot 5)$

The law of sines states $\frac{\sin A}{a} = \frac{\sin B}{b} = \frac{\sin C}{c}$. The a , b and c can be interchanged. The law of cosines states $c^2 = a^2 + b^2 - 2ab \cos C$. The law of sines is generally used in AAS, ASA and SSA triangles whereas the SSS and SAS triangles prefer the law of cosines.

PRECALCULUS prepares students for calculus and the rigors of that course, having been written by teachers who have taught the courses and seen where students need help--and where other texts have come up short. The text features precise definitions and exposition, carefully crafted pedagogy, and a strong emphasis on algebraic, transcendental, and trigonometric functions. To show students how important and

relevant precalculus topics are to their future coursework, an optional Looking Ahead to Calculus feature appears in each chapter. The varied examples and exercises include many that encourage students to use and understand graphs, as opposed to simply draw them, providing additional sound preparation for calculus. This is the last of three volumes that, together, give an exposition of the mathematics of grades 9–12 that is simultaneously mathematically correct and grade-level appropriate. The volumes are consistent with CCSSM (Common Core State Standards for Mathematics) and aim at presenting the mathematics of K–12 as a totally transparent subject. This volume distinguishes itself from others of the same genre in getting the mathematics right. In trigonometry, this volume makes explicit the fact that the trigonometric functions cannot even be defined without the theory of similar triangles. It also provides details for extending the domain of definition of sine and cosine to all real numbers. It explains as well why radians should be used for angle measurements and gives a proof of the conversion formulas between degrees and radians. In calculus, this volume pares the technicalities concerning limits down to the essential minimum to make the proofs of basic facts about differentiation and integration both correct and accessible to school teachers and educators; the exposition may also benefit beginning math majors who are learning to write proofs. An added bonus is a correct proof that one can get a repeating decimal equal to a given fraction by the “long division” of the numerator by the denominator. This proof attends to all three things all at once: what an infinite decimal is, why it is equal to the fraction, and how long division enters the picture. This book should be useful for current and future teachers of K–12 mathematics, as well as for some high school students and for education professionals.
